Wavelength and the speed of sound are basics of audio terms that are dependent on each other. The length of a given frequency wave is dependent on the speed at which the sound wave travels. The speed at which sound travels is dependent on the temperature where the sound wave is occurring. Lower frequencies have a longer wavelengths.

The above formula is for power ratios, while for voltage ratios to be measured in decibels, it is necessary to remember that power is proportional to the square of voltage (from Ohm's law $V = IR$ and $P = I^2R$) $P = V^2 / R$ where P is power, V is voltage, I is amperage, and R is resistance.

Sound comes from vibrations caused by fluctutations in the air pressure. In fact, that's how the ear drum works. It records the pounding of sound waves against it and converts it into something our brain can understand. Sound technicians deal with not only live sound but also electrical "sound."

Understanding Sound - Basics - Behind The Mixer

Sound waves travel through air at approx. 340 m/s (v, depending on temperature and humidity. The oscillating speed of sound is called the frequency f, measured in cycles per second or Hertz [Hz]. The combined length of one high- and one low-pressure zone is called the wavelength λ . We find: $\lambda = v / f$ Hearing We detect sound with our ear-drums.

Sound Engineering Level 1 - Beginners | Udemy

The very basic idea of audio engineering is being able to get sound from one place, to another. For example, if we think about what happens in concerts - sound starts with the vocalist singing into a microphone. Where does the sound go from there? How does the crowd get to hear it coming out of speakers?

What Is Audio Engineering?

The Physics of Sound Sound lies at the very center of speech communication. A sound wave is both the end product of the speech production mechanism and the primary source of raw material used by the listener to recover the speaker's message.
