The concept of ranked set sampling is a recent development that enables one to provide more structure to the collected sample items, although the name is a bit of a misnomer as it is not as much a sampling technique as it is a data measurement technique.

Ranked Set Sampling - College of Arts and Sciences

A stratified ranked set sample (SRSS) is a sampling plan in which a population is divided into L mutually exclusive and exhaustive strata, and a ranked set sample (RSS) of n h elements is quantified within each stratum, h = 1, 2, ..., L.

RANKED SET SAMPLING - National College of Business ...

The goal of ranked set sampling is to collect observations from a population that are more likely to span the full range of values in the population (and, therefore, is more representative of it) than the same number of observations obtained via simple random sampling. What is a ranked set sample (RSS) and how do we collect it?

Bhoj (2001) proposed a ranked set sampling procedure with unequal sample sizes (RSSU). In RSSU we draw m samples where the size of i th sample is $m_i = 2^{i-1}$, $i = 1, 2, \dots, m$. The steps in RSSU are the same as in RSS. In both sampling procedures we measure accurately m observations.

Ranked Set Sample Estimation of Population Mean | Since $E(X_{(i)})$ is distributed like the i-th order statistic for a random sample of size k from a continuous distribution $F(x)$ and density $f(x)$ under perfect ranking (for $i = 1, \dots, k$): $E(X_{(i)}) = \int_0^{\infty} x k! (i-1)!(k-i)! F(x)^{i-1} (1-F(x))^{k-i} f(x) dx$ | This can be written as (with $q = i-1$) $E(X_{RSS}) = \int_0^{\infty} x f(x)$

Ranked Set Sampling - Christof Seiler

Ranked set sampling (RSS) is a method of sampling that can be advantageous when quantification of all sampling units is costly but a small set of units can be easily ranked, according to the character under investigation, without actual quantification.

The method of maximum likelihood estimation based on ranked set sampling (RSS) and some of its modifications is used to estimate the unknown parameters of the new Weibull-Pareto distribution. The estimators are compared with the conventional estimators based on simple random sampling (SRS).

Abstract Ranked set sampling can be useful when measurements are expensive but units from the population can be easily ranked. In this situation one may draw k units from the population, rank them, select one on which to make the expensive measurement, draw another k units, rank them, select one, and so on.
